Star grows by the day!

Reported by Daniel Star.

The once normal star has been rapidly growing bigger. As each day passes the star grows significantly bigger but now astronomers have a different theory as to what is behind it.

The star grows continues to grow.

People all over the globe have been watching the star with baited breath. Questions from government officials, royalty, celebrities, scientists and the general public have whipped the media into a frenzy as they frantically try to discover the answer to what is happening on that once distant star.

So far, no one has stated what could be causing the star to grow so rapidly but some astronomers have said that the star may be entering into the next stage of its life. Dr. Strange from the University of Oxford stated, "This phenomenon has been observed in stars like this before. This star simply is becoming a red giant."

However, some scientists don't believe this to be true. They argue that the star is actually getting closer to the earth and not growing. Professor Red from the National Observatory stated in an interview "The perceived growth is due to perspective.

Actually, the star is hurtling towards us at an incredible speed!"

Needless to say, this caused immeasurable panic with the global population. Members of the public have been stockpiling supplies in preparation for the end of the world. When asked what caused a local resident to buy all of the toilet roll at his local supermarket the man smiled and said "If this star does collide with the earth at least I will have a soft landing." Other residents weren't so optimistic, the population of the UK are trying to push themselves out further into the ocean.

Whatever the cause scientists are desperately trying to find out the cause of the changes in an attempt at preventing any harm coming to planet earth.
